Enter your abstract here. Make sure that you read first carefully the comments inside this document and that you abide by the rules indicated. This is because the content of this file will be parsed by an algorithm to form the booklet. Note that the abstract should not be longer than 1 page in length. We recommend that you perform the edition inside the overleaf environment (<https://www.overleaf.com/project>): a collaborative cloud-based editor allowing free writing of L^AT_EX documents.

It is a good idea to start your abstract with some background and motivation, then describe your approach and summarize the key results. We recommend adding an eye-catching figure that can be referred inside the text through its associated label e.g. Figure. 1 or Eq.(1).

$$\frac{\partial \mathbf{M}}{\partial t} = -\gamma \mathbf{M} \times \mathbf{H}_{\text{eff}} + \alpha \left(\mathbf{M} \times \frac{\partial \mathbf{M}}{\partial t} \right) \quad (1)$$

Figure 1: Magnetic vortex state.

References shall be inserted in the `mylib.bib`-file using the bibtex format ¹. Cite them in the text using commands `[1]`. They will appear automatically together at the end of the abstract sorted by quotation order. Do not try to modify the quotation style.

Final check: make sure that the total length of the abstract is no more than 1 page and that the file compiles without error before uploading it as a zip project inside the conference website. To save the project, click on the home symbol in the upper left corner of the overleaf editor, and download the project as a zip file. The project should be renamed using your corresponding author entry.
